October 1981

Preface

This annual supplement to *Producer Prices and Price Indexes* presents monthly indexes and annual averages for 1980. In most cases, data are the same as revised data published in successive monthly issues of this periodical. The supplement also provides information on the relative importance of index components at the end of the year. In addition, indexes for selected telephone services are included in this supplement for the first time.

Information on changes in the sample for Producer Price Indexes is no longer being published in the annual supplement. Such information can be found in the July 1980, January 1981, and February 1981 issues.

Material in this publication is in the public domain and may, with appropriate credit, be reproduced without permission.

Monthly Indexes and Annual Averages for Producer Price Indexes, 1980

Tables 1 through 10 present 1980 monthly indexes and annual averages for all categories covered under the Producer Price Index program. Most data shown are the revised data published in successive monthly issues of *Producer Prices and Price Indexes*. (All monthly data are subject to revision 4 months after original publication.) However, revised stage-of-processing (SOP) indexes in this supplement may differ from those previously reported because SOP indexes from January 1976 through December 1980 were revised early in 1981 to reflect 1972 input-output relationships. (See the January 1981 issue for further details.)

1980 indexes calculated under the survey for the Producer Price Index Revision program are not presented in this supplement; these data can be found in the monthly issues of this periodical.

[1] Since February 1973, all prices have been lagged one month. Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

[1] Standard Transportation Commodity Code.

[2] The price index for total railroad freight also includes STCC groups not shown separately.

[3] December 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

[1] Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Revised indexes may not agree with previously published revised data because of a comprehensive historical revision which became effective with the April 1981 issue of this publication.

[2] Telephone services contained in the Consumer Price Index cover not only local residential service, but also parts of toll service, equipment leasing (such as extension phones), and nonrecurring charges (such as installation).

Relative importance

Tables 11, 12, and 13 contain relative importance data as of December 1980 by stage-of-processing; by commodity groups, subgroups, product classes, and individual items; and for the output of selected Standard Industrial Classification industries and census product classes.

The relative importance of a category on a specific date represents the value of shipments for that category plus the value of unpriced commodities assumed to have price movements similar to those of the priced items. Relative importance data are generally expressed as a percentage of the total weight of some composite grouping, such as the All Commodities index, the Finished Goods index, etc.

For a description of the procedures for calculating relative importance data, and explanations on how to combine components to construct special indexes, see *Producer Prices and Price Indexes, Supplement 1979, Data for 1978*, pp. 9-13.

[1] The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. See note on relative importance on p. 89.

NOTE: Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005. A dash in the "Former" column indicates a new SOP allocation effective January 1981; a dash in the "Revised" column indicates that the series is no longer included in the indicated SOP category.

[1] Comprehensive relative importance figures are computed once each year in December. See note on p. 89. The "Revised" column shows relative importance figures for December 1980 based on 1972 shipment values from the Census of Manufacturers and other sources, after the sample revision effective January 1981; the "Former" relative importance figures are for the same month before the revision of the index sample. A dash in the "Former" column indicates that series was introduced in January 1981, and a dash in the "Revised" column indicates that the series was discontinued as of January 1981.

[3] Recoded effective January 1981.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary arkets of the United States by producers of commodities in all stages of procssing. These data were previously presented as the Wholesale Price Index. The ame "Producer Price Indexes" is now being used to reflect more accurately the overage of the data. The sample used for calculating these indexes continues to ontain nearly 2,800 commodities and about 10,000 quotations selected to epresent the movement of prices of all commodities produced in the manufacuring, agriculture, forestry, fishing, mining, gas and electricity, and public tilities sectors. The universe includes all commodities produced or imorted for sale in commercial transactions in primary markets in the United tates.

Producer price indexes can be organized by stage of processing or by comodity. The stage-of-processing structure organizes products by degree of abrication (i.e., finished goods, intermediate or semifinished goods, and crude aterials). The commodity structure organizes products by similarity of end-use r material composition.

Finished goods are commodities that will not undergo further processing and re ready for sale to the ultimate user, either an individual consumer or a usiness firm. Capital equipment (formerly called producer finished goods) inludes commodities such as motor trucks, farm equipment, and machine tools. inished consumer goods include foods and other types of goods eventually urchased by retailers and used by consumers. Consumer foods include unrocessed foods such as eggs and fresh vegetables, as well as processed foods uch as bakery products and meats. Other finished consumer goods include urables such as automobiles, household furniture, and jewelry, and nonurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have een processed but require further processing before they become finished oods. Examples of such semifinished goods include flour, cotton yarns, eel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values of all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change

Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0

Index Percent Change

Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Data from the 1980 Producer Price Index (PPI) revision are not included in this supplement because of limited resources. They will be found in the monthly issues of this report in table 4, "Producer price indexes for the net output of selected industries and their products." Table 4 of the monthly issues of this report includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7 digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed monthly in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published monthly in table 4 correspond to 8-digit commodities published monthly in table 6 (table 3 of this supplement). Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI'S in tables 11, 12, and 13 (tables 7 and 8 of this supplement). In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI'S do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Producer Prices and Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights and changes in the sample. A subscription may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Subscription price:
$17 a year domestic (includes supplement)
$4.25 additional foreign

Single copy $2.25
Supplement $2.75

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 1983. Controlled circulation postage paid at Washington, D.C. Price Movements
January 1980

The Producer Price Index for Finished Goods advanced 1.6 percent from December to January on a seasonally adjusted basis. The January increase was considerably larger than the average monthly rise of 1.0 percent in 1979. Prices for intermediate (semifinished) goods increased 2.8 percent, far more than in any month last year. Prices for crude materials, however, declined 0.9 percent, entirely because of lower prices for crude foodstuffs (table A).

The acceleration in the Finished Goods Price Index was caused by sharply higher prices for energy goods, consumer goods other than food and energy, and capital equipment. In contrast, the consumer foods index fell 0.8 percent, after rising in 5 of the preceding 6 months (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 1.9 percent to 232.1 (1967=100). Over the year, the Finished Goods Price Index moved up 13.0 percent. The index for finished energy goods advanced 66.5 percent from January 1979 to January 1980, finished consumer foods rose 5.1 percent, finished consumer goods less foods and energy increased 11.0 percent, and capital equipment prices moved up 9.5 percent. The Producer Price Index for intermediate goods was 17.7 percent higher than in January 1979, and crude material prices increased 14.1 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 1.6 percent in January, more than in any other month since the fall of 1974. Prices for consumer durables, consumer nondurables other than food, and capital equipment all rose twice as much as

in the previous month.

The index for consumer durables advanced 3.2 percent in January after rising 1.6 percent in December and 1.0 percent in November. Much of the acceleration was caused by steep price increases for household flatware (54.6 percent) and precious metal jewelry (22.5 percent), both of which resulted from escalating prices for gold and silver. Passenger car prices also rose much faster in January (2.0 percent vs. 0.6 percent in December).

Prices for consumer nondurables other than foods rose 2.6 percent in January, about twice as much as in each of the previous 2 months. Price increases accelerated for gasoline (5.7 vs. 3.2 percent), home heating oil (2.0 vs. 0.1 percent), and tobacco products (4.4 vs. 2.0 percent). Prices also advanced more than in December for cosmetics, toys, sanitary papers and health products, soaps and detergents, textile housefurnishings, tires and tubes, bicycles, and finished lubricants. Nonalcoholic beverages and apparel prices turned up after little or no change in December.

The index for finished consumer foods fell 0.8 percent after rising 0.2 percent in December and 2.0 percent in November. Prices declined for beef and veal, pork, eggs, and fresh fruits after rising a month earlier. Prices for fresh and dried vegetables, roasted coffee, and processed poultry also fell. On the other hand, prices for dairy products and bakery products rose faster than in December. Prices also moved up for processed fruits and vegetables, fish, refined sugar in consumer size packages, and milled rice.

Capital equipment. The index for capital equipment rose 1.6 percent, about twice as much as in each of the previous 4 months. Prices for motor trucks advanced 1.1 percent, more than in December but less than in the 2 months prior to that. Aircraft prices turned up after declining in December. Prices rose faster than in December for construction machinery, agricultural machinery, office and store machinery, generators and generator sets, machine tools, and railroad equipment.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 2.8 percent seasonally adjusted from December to January, the largest increase since August 1974. This acceleration was chiefly the result of substantial price rises for precious metals, fuels, and energy-intensive products. However, the index for intermediate foods and feeds registered the sharpest decline in over 2 years.

The index for intermediate materials less foods and feeds advanced 3.0 percent. The durable manufacturing materials category increased 5.5 percent following a 1.3 percent upward movement in December. Precious metal prices rose 94.7 percent, accounting for about one quarter of the increase in the total intermediate materials index. Higher precious metal prices led to a 38.7 percent advance in the index for jewelers' materials and findings. The rate of advance also accelerated in the price indexes for semifinished steel mill products, copper, flat glass, and plastic parts and components. Prices also rose, but less than in December, for nickel, laminated plastic sheets, and foamed plastic products. Lead prices fell sharply.

The processed fuels and lubricants index moved up 4.8 percent, the largest rise since August. Price increases accelerated for residual fuels, liquefied petroleum gas, commercial jet fuel, and diesel fuel. Electric power rates moved up, but not as much as in the previous month.

The nondurable manufacturing materials category rose 2.5 percent, nearly twice as much as in December. Prices increased much more than in the previous month for industrial chemicals, synthetic rubber, plastic resins and materials, adhesive resins, woodpulp, paperboard, finished fabrics, and synthetic fibers. Prices continued to rise sharply for phosphates and nitrogenates.

The index for construction materials also moved up more than in December. Higher prices were recorded for concrete products, Portland cement, asphalt roofing, bituminous paving materials, prepared paint, and nonferrous wire and cable. On the other hand, prices for both softwood lumber and plywood fell for the third consecutive month.

In the manufacturing components category, large price increases occurred for electronic components, electric motors, switchgear and switchboards, internal combustion engines, and bearings. Several other industrial products registered substantial price hikes, including paper boxes and containers, metal cans, electric lamps and bulbs, and mixed fertilizers.

The intermediate foods and feeds index fell 2.7 percent, the largest decline since July 1977. Prices were sharply lower for manufactured animal feeds, vegetable oils, refined sugar for food manufacturing, confectionery materials, and flour. In contrast, prices for animal fats and oils rose substantially.

Crude materials

The Producer Price Index for crude materials for further processing declined 0.9 percent on a seasonally adjusted basis, following increases ranging between 1.0 and 2.2 percent in each of the last 4 months of 1979. Prices for crude foodstuffs turned down sharply following a slight increase in December, but crude nonfood materials continued to rise sharply.

The index for crude foodstuffs and feedstuffs fell 3.8 percent following a 0.3 percent increase in December. Much of the fall was due to sharply lower prices for coffee, corn, and hogs, all of which had risen somewhat in the preceding month. Soybeans, wheat, and cattle prices moved down considerably more than in the previous month. Prices for cocoa beans and raw sugar increased but not as much as in December.

The index for crude nonfood materials less energy rose 2.4 percent following a 0.2 percent increase in December. The acceleration was due to sharply higher prices for nonferrous scrap, cotton, sand, gravel and crushed stone, wastepaper, natural rubber, and potash. On the other hand, iron and steel scrap prices fell much more than in December.

Prices for crude energy materials rose 3.0 percent over the month, somewhat less than the 4.1 percent advance in December, but more than in either of the 2 preceding months. Domestic crude petroleum prices moved up 9.1 percent, double the December rise, but natural gas prices fell 1.0 percent following a steep advance in December.

Seasonal Adjustment Procedures

Effective with this issue, seasonal adjustment factors have been recalculated to reflect 1979 experience for stage-of-processing (SOP) groupings, commodity groupings, and groupings by durability of product. This routine annual recalculation may affect seasonally adjusted data from January 1975 to the present. Revised seasonally adjusted data for this period, as well as seasonal factors to be used through December 1980, are available on request from BLS. Table C compares percent changes for seasonally adjusted indexes calculated with the old seasonal factors and seasonally adjusted indexes recalculated with the new factors for the three major SOP categories.

Data from the Producer Price Index Revision

The first group of industry price indexes calculated from the comprehensive program to revise the Producer Price Index (PPI) will now be published each month in this report in table 4: "Producer price indexes for the net output of selected industries and their products." Output price indexes from the PPI revision will be published for 16 industries in the manufacturing and mining sectors of the economy. In addition to these industry output price indexes, data are also available beginning this month for selected product classes and products in each of these industries.

Data which previously appeared in table 14 for the four industries in the pilot survey for the PPI revision now appear in the new table 4. The former table 4, "Producer price indexes and percent changes for commodity groupings," no longer will be published. The former table 15, "Price indexes and percent changes for total railroad freight and selected STCC groups," has been renumbered table 14.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. However, those traditional indexes which correspond to new indexes published in the revision program are now based on the movements of the corresponding revision indexes. (See tables D and E.) As new industries are published, their product indexes will also be used in the traditional commodity and ISPI structures. In 1983, an entirely new structure will replace the traditional commodity structure as the primary vehicle for reporting and analyzing price changes at the primary market level.

The new indexes calculated for the PPI revision differ from traditional commodity price indexes and ISPI's in several important respects:

(1) Coverage will eventually be expanded to include *all production in mining and manufacturing industries,* whereas traditional commodity indexes have covered only about half of this value. The 16 industries now being published from the revision program account for 3.9 percent of all mining and manufacturing production.

(2) New indexes are classified according to the widely used *Standard Industrial Classification (SIC)* and incorporate most features of the Census of Manufactures product code extensions of the SIC. Traditional commodity price indexes are grouped by a classification structure unique to BLS and are therefore difficult to use with industry-oriented economic data.

(3) New indexes use *net output values of shipments as weights* rather than gross output values. New output values refer to the value of shipments leaving the industry and thus exclude intra-industry shipments. Therefore, new indexes consistently eliminate multiple counting of price changes at successive stages of processing. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

(4) New indexes emphasize *actual transaction prices at time of shipment* to minimize the use of list prices and order prices which occasionally have been used in traditional commodity price indexes and ISPI's.

(5) New indexes are based on prices reported for a broader range of products and by companies of all sizes selected by *probability sampling methods* rather than by a judgment of volume-selling products and major producers.

See Technical Note, "Data from the Producer Price Index Revision," at the back of this publication for further detail.

The following industries are being published in the first phase of the PPI revision:

SIC code	*Industry title*
1111	Anthracite
2075[1]	Soybean oil mills
2272	Tufted carpets and rugs
2511	Wood household furniture, except upholstered

[1] Comprehensive relative importance figures are computed once each year in December.

[2] Data for September 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Includes crude petroleum.

[5] Excludes crude petroleum.

[6] Percent of total finished goods.

[7] Percent of total intermediate materials.

[8] Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

[9] Percent of total crude materials.

NOTE: Seasonal adjustment factors have been recalculated to reflect developments during 1979. Therefore, some seasonally adjusted data shown above may differ from those previously reported.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) Index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See Technical Note on data from the Producer Price Index revision at the back of this publication.

[2] Data for September 1979 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

[3] Seasonal commodity—no price available this month.

[4] Some of the titles of the individual commodity price indexes included in this grouping are not shown.

[5] Not available.

[6] Prices for some items in this grouping are lagged 1 month.

[7] Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

[8] Prices for natural gas (05-31) are lagged 1 month.

[9] Includes only domestic production. Some prices are lagged 1 month.

[10] Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuel (05-74) are lagged 1 month.

[11] Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

[12] Some prices for industrial chemicals (06-1) are lagged 1 month.

N.E.C. Not elsewhere classified.

[1] Data for September 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

[2] The price index for total railroad freight also includes STCC groups not shown separately.

[3] Dec. 1978 = 100.

Special note: This table presents revised price indexes for 1979 for total railroad freight and its published subgroups. These revisions come from two general sources:

1. Partly as a result of late, lost or misfiled tariff supplements, associated with the very rapid changes in tariffs during 1979, some shipments had to be repriced in one or more months; and
2. Some data errors were discovered in the universe frame from which the new sample, introduced with the release of the May indexes, was selected.

Although, in general, the revised indexes rise slightly more rapidly than the previously published ones, both the general trends and individual monthly changes are basically the same.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

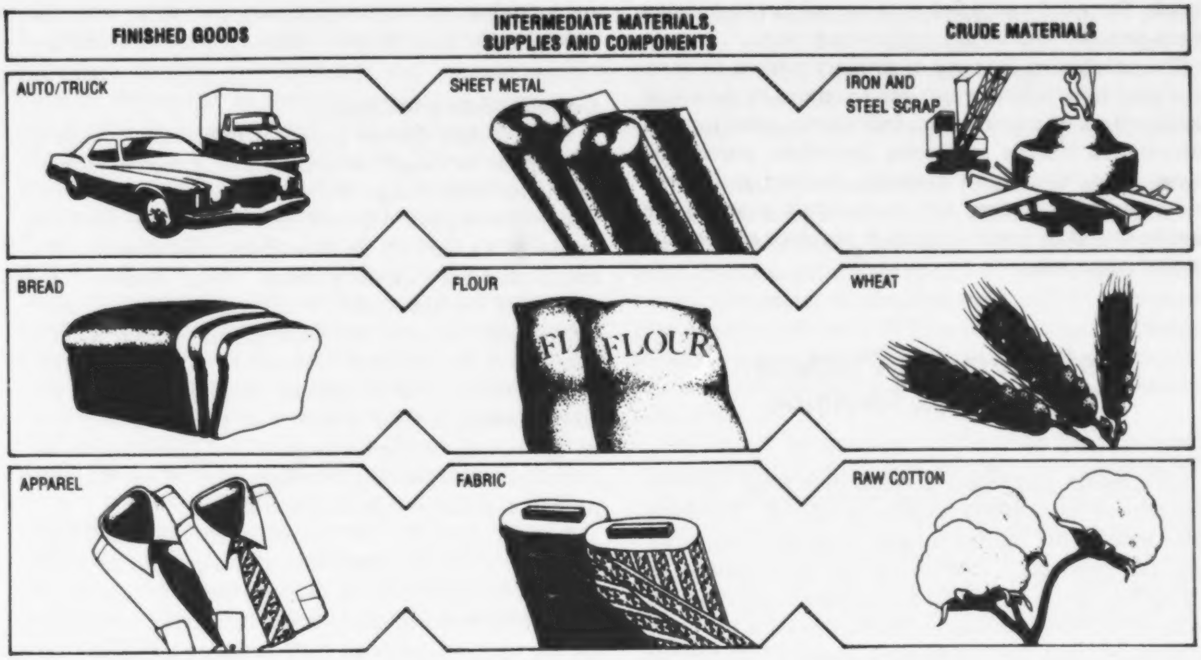
Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed



data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical

trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based.* The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Price Movements
February 1980

The Producer Price Index for Finished Goods advanced 1.5 percent from January to February on a seasonally adjusted basis. The increase in February was nearly as large as in January and matched the biggest monthly increase in 1979. Prices for intermediate (semifinished) goods moved up 1.8 percent, considerably less than in January but more than in any month last year. After falling in January, the crude materials price index rose 2.6 percent (table A).

Among finished goods, prices for energy goods climbed 7.5 percent, considerably more than in any month since March 1974. Consumer food prices fell slightly for the second consecutive month, after rising at an 8.3 percent rate during the fourth quarter of 1979. Although prices for consumer goods less food and energy did not rise as sharply as in January, the February advance of 1.5 percent was larger than any monthly rise in 1979. Capital equipment prices increased 0.7 percent, much less than in the previous month and the same as the average monthly rise last year (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 1.4 percent to 235.4 (1967=100). Over the year, the Finished Goods Price Index moved up 13.3 percent. The index for finished energy goods climbed 75.8 percent from February 1979 to February 1980, the finished consumer foods index rose 2.9 percent, finished consumer goods less food and energy advanced 11.8 percent, and capital equipment prices moved up 9.3 percent. Prices for intermediate goods increased 18.6 percent over the year, and the Producer Price Index for crude materials was 14.0 percent higher than in February 1979.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 1.8 percent in February seasonally adjusted, following a 1.6 percent increase in January. Energy prices rose 7.5 percent, up sharply from the 4.4 percent advance in January, as increases accelerated

for both gasoline (8.3 vs. 5.7 percent) and home heating oil (6.7 vs. 2.0 percent). Among consumer nondurables other than food and energy, price increases for tires and tubes accelerated from 1.4 percent in January to 4.5 percent in February. Prices also rose more than in the previous month for apparel, sanitary papers and health products, and disposable plastic dinnerware. Prices for tobacco products, razor blades, and cosmetics showed little or no change after advancing sharply a month earlier.

Prices for consumer durables rose considerably less in February (1.8 percent) than in January (3.2 percent). Prices for precious metal jewelry rose sharply, but not as much as in January (16.6 vs. 22.5 percent). Prices for flatware were virtually unchanged after rising 54.6 percent a month earlier. Prices for passenger cars edged down 0.4 percent after rising 2.0 percent in January. Prices rose more than in the previous month for household appliances, household furniture, and mobile homes.

The index for finished consumer foods declined 0.5 percent in February after falling 0.8 percent in January. Decreases were registered for processed poultry, pork, fresh and dried vegetables, eggs, roasted coffee, and whole black pepper. On the other hand, prices for beef and veal and fresh fruits turned up after declining in January, and prices for refined sugar in consumer size packages climbed 32.4 percent. Prices also rose for bakery products and milled rice.

Capital equipment. The index for capital equipment rose 0.7 percent, less than the 1.6 percent rise in January, but about the same as in most other recent months. Prices for motor trucks, aircraft, railroad equipment, machine tools, office machines, oilfield and mining machinery, construction machinery, agricultural machinery, and most other kinds of capital equipment rose less than in the previous month. On the other hand, prices did rise more than in January for generators and generator sets, commercial furniture, transformers and power regulators, photographic equipment, industrial material handling equipment, and integrating and measuring instruments.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components advanced 1.8 percent in February on a seasonally adjusted basis, less than the 2.8 percent increase in January but more than in any other month since October 1974. Most of the slowdown was due to lower prices for precious metals. Prices for many other kinds of intermediate goods, however, continued to rise sharply.

The intermediate energy index increased 4.5 percent, about as much as in January. Prices rose more than in the previous month for diesel fuel, commercial jet fuel, liquefied petroleum gas, electric power, and lubricating oil materials. However, prices for residual fuel rose much less than in January, and coke prices continued to decline.

The index for intermediate materials less food and energy moved up 1.1 percent, less than half as much as in January. Prices for durable manufacturing materials edged up 0.2 percent after climbing 5.5 percent in the preceding month. Silver and gold prices declined 12.0 and 6.5 percent, respectively, following unusually steep advances in January. However, higher prices were recorded for copper, lead, zinc, foundry and forge shop products, jewelers' materials and findings, and laminated plastic sheets.

The index for nondurable manufacturing materials increased 1.0 percent, following a 2.5 percent advance in January. Prices for industrial chemicals, plastic resins, synthetic rubber, paperboard, and finished fabrics rose much less than in the previous month. Prices for inedible fats and oils, leather, woodpulp, and synthetic fibers declined after rising in January.

The construction materials index rose 1.3 percent, following a 0.9 percent rise in January. Price increases accelerated for nonferrous wire and cable, bituminous paving materials, asphalt roofing, building paper and board, plumbing fixtures and brass fittings, and heating equipment. Prices turned up after declining in January for plywood, softwood lumber, and gypsum products.

The components for manufacturing index advanced more (1.7 percent) than in January (1.5 percent). Prices rose substantially for electronic components, motor vehicle parts, switchgear and switchboards, fluid power equipment, and bearings.

The largest price increase among other intermediate goods was the 51.1 percent jump in the index for photographic supplies. This reflected the recent steep increases in prices for silver, which is used in making photographic film and paper.

The intermediate foods and feeds index rose 5.5 percent, following a sharp drop in January. Most of the turnaround was caused by a 39.1 percent rise in prices for refined sugar used in food manufacturing. Prices increased after falling in the previous month for manufactured animal feeds, flour, refined vegetable oils, and confectionery materials.

Crude materials

The Producer Price Index for crude materials for further processing increased 2.6 percent in February on a seasonally adjusted basis, following a 0.9 percent decrease in January. Prices for crude foodstuffs and feedstuffs turned up markedly, following a sharp decrease in the previous month, and crude nonfood materials rose even more than in January.

The index for crude foodstuffs and feedstuffs moved up 2.2 percent, following a 3.8 percent decrease in January. Prices for cattle, grains, soybeans, and green coffee, all of which had decreased in the previous month, turned up in February. Raw cane sugar prices rose 43.9 percent over the month, and cocoa beans rose substantially for the third consecutive month. In contrast, live poultry prices fell sharply after rising in each of the 6 months prior to February. Hog prices fell for the second consecutive month.

The index for crude nonfood materials less energy rose 4.4 percent, following a 2.4 percent increase in January. Sharply higher prices were recorded for nonferrous scrap, cotton, and natural rubber. Prices for iron ore, iron and steel scrap, and sand and gravel also rose. On the other hand, prices for hides and skins, wastepaper, and potash fell after rising in the previous month.

Prices for crude energy materials rose 2.4 percent, somewhat less than the 3.0 percent advance in January. Natural gas prices rose 5.4 percent after declining 1.0 percent in January, but crude petroleum edged up only 0.3 percent, following a 9.1 percent climb in the preceding month.

[1] Comprehensive relative importance figures are computed once each year in December.

[2] Data for October 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Includes crude petroleum.

[5] Excludes crude petroleum

[6] Percent of total finished goods.

[7] Percent of total intermediate materials.

[8] Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco".

[9] Percent of total crude materials.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See Technical Note on data from the Producer Price Index Revision at the back of this publication.

[2] Data for October 1979 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

[3] Seasonal commodity—no price available this month.

[4] Some of the titles of the individual commodity price indexes included in this grouping are not shown.

[5] Not available.

[6] Prices for some items in this grouping are lagged 1 month.

[7] Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

[8] Prices for natural gas (05-31) are lagged 1 month.

[9] Includes only domestic production. Some prices are lagged 1 month.

[10] Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

[11] Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

[12] Some prices for industrial chemicals (06-1) are lagged 1 month.

[13] The price shown in the January 1980 issue for dometic copper, cathode (10-22-01-06) was incorrect; the correct price was $1.101 per pound.

N.E.C. Not elsewhere classified.

[1] Data for October 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

[3] The figure shown for each item is its percent of total railroad freight.

[4] Dec. 1978=100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

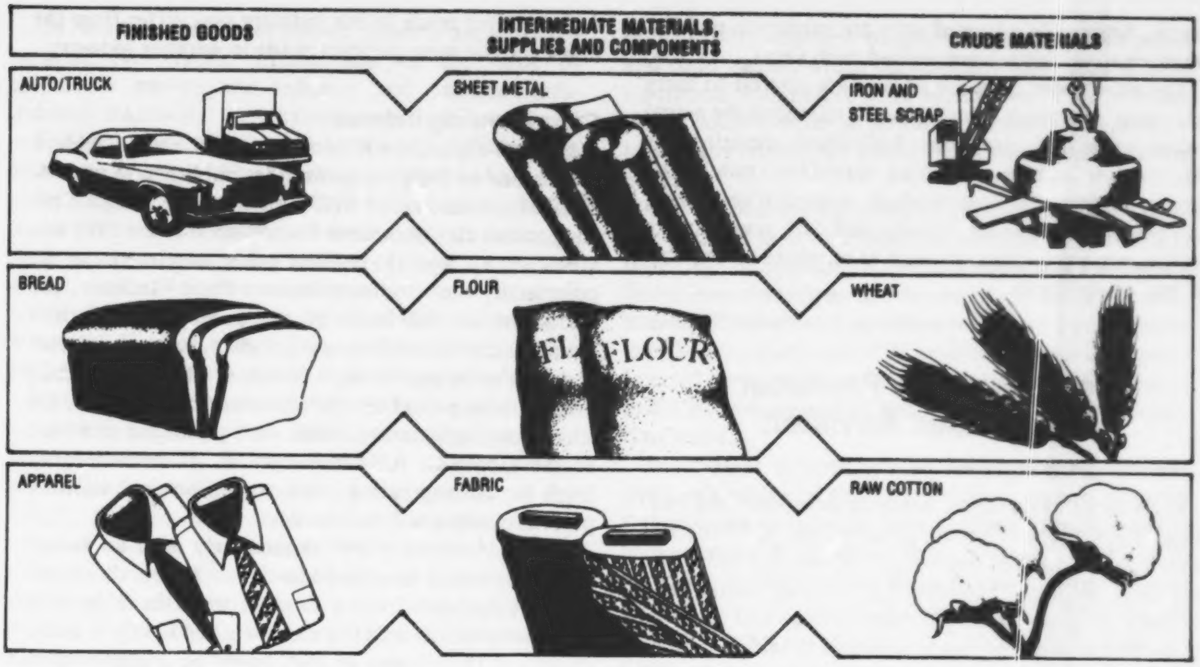
Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed



data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical

trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based.* The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Analysis of Work Stoppages

U.S. Department of Labor
Bureau of Labor Statistics

This bulletin provides a detailed statistical presentation of work stoppages in 1977, including historical comparisons. Stoppages are tabulated by industry, occupation, location, type of settlement, and impasse procedures as well as four major charactertics: (1) size, (2) duration, (3) contract status, and (4) major issue.

Terms of settlement are provided for stoppages involving 10,000 workers or more. Stoppages in government are further distinguished by level of government and function. The statistical series includes all stoppages in the United States that involve six workers or more and continue for the equivalent of a full day or shift or longer.

Price Movements
March 1980

The Producer Price Index for Finished Goods moved up 1.4 percent from February to March on a seasonally adjusted basis. The March advance was not quite as large as the increase reported for either January or February. Prices for intermediate (semifinished) goods rose 0.5 percent, less than in any month since July 1978. Crude material prices declined 2.2 percent following a 2.6 percent rise in February and a 0.9 percent drop in January (table A).

Among finished goods, prices for energy goods increased 7.2 percent, nearly as much as in February and considerably more than in any other month in the past 6 years. Consumer food prices rose 1.1 percent, following declines in each of the first 2 months of the year. Prices for consumer goods other than food and energy moved up 0.4 percent, much less than in either January or February. Capital equipment prices rose 0.8 percent, about the same as in most recent months (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 1.2 percent to 238.2 (1967=100). Over the year, the Finished Goods Price Index advanced 13.9 percent. The index for finished energy goods climbed 82.2 percent from March 1979 to March 1980, the finished consumer goods index rose 3.0 percent, finished consumer goods other than food and energy advanced 11.5 percent, and capital equipment prices were 9.5 percent higher than a year ago. Prices for intermediate goods were up 18.0 percent over the year, and the Producer Price Index for crude materials increased 9.7 percent.

March, seasonally adjusted, the same as in January and slightly less than in February (1.8 percent). Energy prices continued to advance at an unusually rapid pace. Gasoline prices rose 8.5 percent, and prices for home heating oil rose 6.3 percent; both of these increases were about the same as in the preceding month.

The index for finished consumer foods advanced 1.1 percent after declining 0.8 and 0.5 percent in January and February, respectively. Prices turned up sharply for eggs, pork, and fresh and dried vegetables after decreasing in February. Price increases accelerated for fish, milled rice, confectionery end products, and cake mixes. On the other hand, prices for beef and veal, refined sugar in consumer size packages, and fresh fruits turned down after rising sharply in the previous month. Prices for processed poultry and roasted coffee also fell but not as much as in February.

Price increases slowed markedly for consumer finished goods other than food and energy in March. Most of the slowdown was due to prices for precious metal jewelry, which declined 11.0 percent after climbing 55.3 percent from November through February. Prices for tires and tubes also declined after a sharp increase in February. Prices for apparel, household furniture, household appliances, mobile homes, sanitary papers and health products, and nonalcoholic beverages rose but not as much as in the preceding month. On the other hand, prices for leather footwear, flatware, and floor coverings turned up *after declining in February.*

Capital equipment. The index for capital equipment rose 0.8 percent, about the same as in the previous month. Some of the largest advances occurred for pumps and compressors, motor trucks, generators and generator sets, machine tools, commercial furniture, agricultural machinery, oilfield machinery, chemical industry machinery, and industrial process furnaces.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components moved up 0.5 percent in March, seasonally adjusted, much less than in either January (2.8 percent) or February (1.8 percent). This slowdown was partly due to lower prices for nonferrous metals, foods, and feeds. In addition, price increases moderated for some energy products.

The intermediate energy index moved up 3.1 percent, following 2 months of more substantial increases. Prices rose less than 1 percent (much less than in February) for electric power, liquefied petroleum gas, residual fuel, and lubricating oil materials. Commercial jet fuel and diesel fuel prices, however, both rose more than 5 percent for the second consecutive month.

The intermediate foods and feeds index fell 3.0 percent, in contrast to a 5.5 percent jump in the preceding month. Prices declined for refined sugar used in food manufacturing, feeds, crude and refined vegetable oils, and flour. On the other hand, corn syrup prices rose *sharply.*

The index for intermediate materials less food and energy rose 0.3 percent, much less than for any month in over a year. Much of the slowdown was caused by the durable manufacturing materials grouping, which declined 1.7 percent as prices for copper, gold, silver, and jewelers' materials all fell between 15 and 25 percent. Lead prices were also lower. In contrast, the indexes for nickel, tin, and zinc rose substantially.

The construction materials index advanced 1.1 percent, nearly as much as in February. Some of the largest price increases occurred for fabricated structural metal products, nonferrous wire and cable, bituminous paving materials, concrete products, and millwork; prices for most other construction materials also moved up. On the other hand, prices for softwood lumber and plywood turned down.

Prices for many nondurable manufacturing materials continued to rise sharply including industrial chemicals, paper, phosphates, and nitrogenates. In addition, the indexes for finished fabrics, and synthetic fibers registered substantial increases after little or no change in the previous month. In contrast, prices for leather and inedible fats and oils declined for the second consecutive month.

In the manufacturing components category, the rate of increase for electronic components slowed considerably. Prices continued to move up substantially, however, for motor vehicle parts, switchgear and switchboards, and internal combustion engines. Among other intermediate goods, prices for photographic supplies were virtually unchanged following an increase of more than 50 percent in February. Price increases also slowed for many types of machinery parts. In contrast, large increases were registered for plastic parts, pesticides, and mixed fertilizers.

Crude materials

The Producer Price Index for crude materials for further processing declined 2.2 percent in March on a seasonally adjusted basis, following a 2.6 percent increase in February. Prices for crude foodstuffs and feedstuffs turned down sharply, following a marked increase in February, and crude nonfood material prices fell 1.4 percent, the sharpest drop since June 1977.

The index for crude foodstuffs and feedstuffs decreased 2.7 percent, following a 2.2 percent increase in February. Prices for raw cane sugar fell 26.4 percent after climbing 43.9 percent in the previous month. Livestock, soybeans, grains, and cocoa beans also fell after rising in February. Poultry prices moved down, but the fall was much less than in February. In contrast, green coffee prices moved up considerably more than in the previous month. Fluid milk prices also rose.

The index for crude nonfood materials less energy fell 4.9 percent, in contrast to a 4.4 percent increase in February. Prices for copper base scrap, cotton, iron and steel scrap, and natural rubber fell following increases in February. Hides and skins and wastepaper moved down considerably for the second consecutive month. On the other hand, prices for aluminum base scrap and potash rose.

Prices for crude energy materials rose 0.6 percent, much less than the 2.4 percent advance in February. Natural gas prices edged down following a substantial rise in February, but crude petroleum and coal prices increased more than in the preceding month.

[1] Comprehensive relative importance figures are computed once a year in December.

[2] Data for November 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Includes crude petroleum.

[5] Excludes crude petroleum.

[6] Percent of total finished goods.

[7] Percent of total intermediate materials.

[8] Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

[9] Percent of total crude materials.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) Index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[1] Indexes with a commodity point code of .99 are calculated by a revised methodology. See Technical Note on data from the Producer Price Index Revision at the back of this publication.

[2] Data for November 1979 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

[3] Seasonal commodity—no price available this month.

[4] Some of the titles of the individual commodity price indexes included in this grouping are not shown.

[5] Not available.

[6] Prices for some items in this grouping are lagged 1 month.

[7] Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

[8] Prices for natural gas (05-31) are lagged 1 month.

[9] Includes only domestic production. Some prices are lagged 1 month.

[10] Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

[11] Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

[12] Some prices for industrial chemicals (06-1) are lagged 1 month.

N.E.C. Not elsewhere classified.

* January and/or February 1980 prices for these commodities were inadvertently shown to be ten times larger than their actual value. Index values for these months were not affected by this problem. The corrected prices are as follows:

[1] Data for November 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

[2] Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

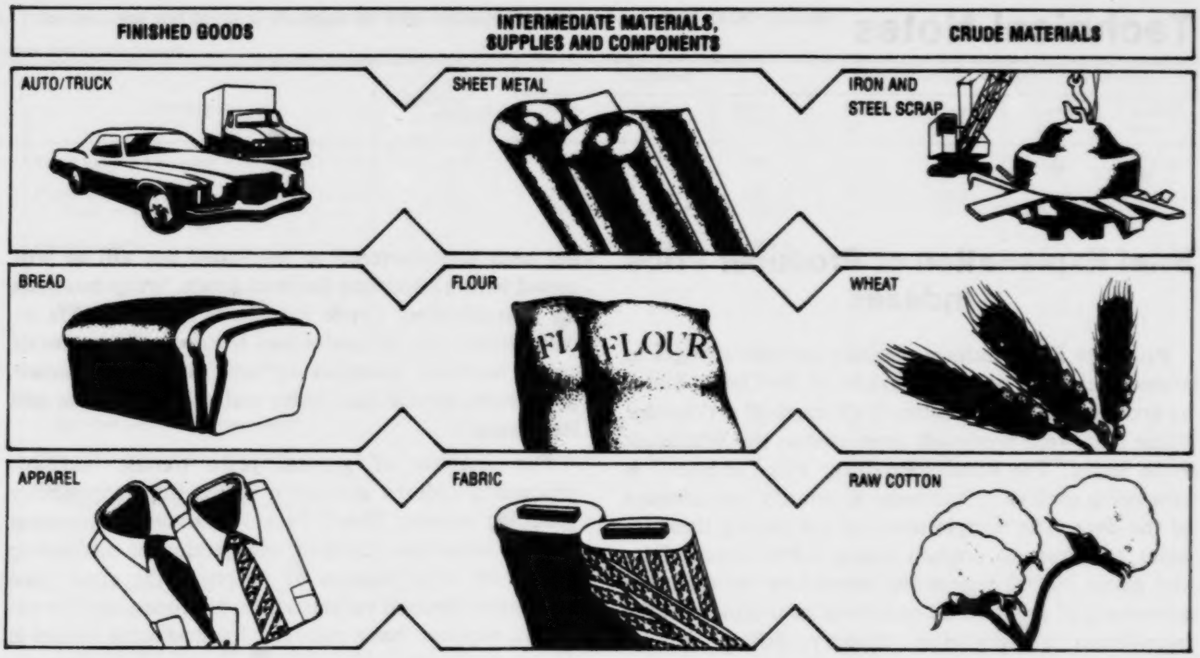
Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed



data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from $100 in 1967 to $225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical

trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables, 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights.* Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling.* In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodolgy of the PPI revision, see two *Monthly Labor Review* articles by John F. Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979. Producer Prices and Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights and changes in the sample. A subscription may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Subscription price:
$17 a year domestic (includes supplement)
$4.25 additional foreign

Single copy $2.25
Supplement $2.75

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 1983. Controlled circulation postage paid at Washington, D.C. Price Movements
April 1980

The Producer Price Index for Finished Goods moved up 0.5 percent from March to April on a seasonally adjusted basis. This was much less than in any month during the first quarter of 1980 and was the smallest rise since last May. Prices for intermediate (semifinished) goods edged up 0.1 percent, the smallest increase since July 1977. Crude material prices dropped 3.5 percent, the third decline in the last 4 months (table A).

Among finished goods, consumer food prices fell 2.8 percent after advancing 1.1 percent in March and decreasing in January and February. Prices for finished energy goods rose 3.8 percent, following 2 months of increases of more than 7 percent. The index for consumer goods other than food and energy increased 0.6 percent, more than in March but much less than in either January or February. Capital equipment prices climbed 1.9 percent, more than twice as much as in either of the 2 preceding months (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.8 percent to 240.0 (1967=100). Over the year, the Finished Goods Price Index increased 13.5 percent. Prices for finished energy goods climbed 81.3 percent from April 1979 to April 1980, prices for finished consumer foods edged up 0.4 percent, the index for finished consumer goods other than food and energy rose 11.5 percent, and capital equipment prices advanced 10.2 percent. The Producer Price Index for intermediate materials was 16.4 percent higher than a year ago, and crude material prices were up 6.1 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods was unchanged from March to April; this index had increased more than 1 percent in 8 of the 9 preceding months. Lower food prices in April

offset advances for nonfood goods, primarily energy goods.

The index for finished foods fell 2.8 percent after rising 1.1 percent in March. Much of the turnaround was caused by sharply lower prices for beef and veal (down 8.7 percent), pork (down 7.8 percent), and poultry (down 5.0 percent). Prices turned down after advancing in March for eggs, fish, milled rice, and vegetable oil end products. Prices fell more than in the previous month for refined sugar in consumer size packages, roasted coffee, and fresh fruits. Fresh and dried vegetable prices rose only slightly after a substantial advance in March. On the other hand, prices rose faster than in March for dairy products and tea.

Prices for energy goods increased 3.8 percent in April, after rising 7.5 and 7.2 percent in February and March, respectively. Price increases for both gasoline and home heating oil (up 4.3 and 3.0 percent, respectively) were much smaller than in either of the 2 preceding months. The index for finished consumer goods other than food and energy rose 0.6 percent, somewhat more than the 0.4 percent rise in March. Sharp declines for gold jewelry (down 9.8 percent) and household flatware (down 27.7 percent) were more than offset by advances for a broad range of other products, particularly passenger cars, cosmetics, pharmaceutical preparations, silver and costume jewelry, nonalcoholic beverages, household furniture, and mobile homes.

Capital equipment. The index for capital equipment rose 1.9 percent, more than in any other month since October 1974. Price increases accelerated for most types of capital equipment. The largest advances occurred for motor trucks, plastic and rubber industry machinery, construction machinery, machine tools, oilfield machinery, agricultural machinery, and electric generators.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components edged up 0.1 percent on a seasonally adjusted basis, following steep climbs in January and February (up 2.8 and 1.8 percent, respectively) and a 0.5 percent increase in March. The rate of advance for energy products slowed dramatically for the second consecutive month, construction material prices turned down, and prices for nonferrous metals and for foods and feeds declined about as sharply as in March.

The intermediate energy index rose 0.9 percent, less than in any month since February 1979. Prices for residual fuel and liquefied petroleum gas were lower following slight increases in March. Prices for diesel fuel and commercial jet fuel continued to climb, but not as much as in any of the first 3 months of the year.

The intermediate foods and feeds index fell 2.7 percent, following a 3.0 percent decrease in March. Prices continued to decline sharply for feeds, vegetable oils, and animal fats and oils. On the other hand, prices for refined sugar used in food manufacturing turned up after falling in March, and corn syrup prices continued to increase substantially. The index for intermediate materials less food and energy rose 0.2 percent, about the same as in March but much less than in any other month in over 2 years. The durable manufacturing materials category fell 1.9 percent, about the same as in March. Considerably lower prices were recorded for silver (down 51.5 percent), gold, copper, lead, tin, zinc, hardwood lumber, and jewelers' materials. In contrast, prices for finished steel mill products and primary aluminum both rose about 3 percent.

The construction materials index edged down 0.2 percent, following sharp advances during the first quarter of 1980. Prices fell sharply for softwood lumber, millwork, and plywood as a consequence of weaker demand from the housing construction market. Nonferrous wire and cable prices dropped due to lower copper prices. However, large increases were registered for fabricated structural metal products, bituminous paving materials, concrete products, structural clay products, prepared paint, and valves and fittings.

The nondurable manufacturing materials category advanced 1.5 percent, more than in either of the 2 previous months. Substantial increases occurred for several petroleum-derived products, including industrial chemicals, plastic resins and materials, and synthetic rubber. Prices also rose sharply for woodpulp, processed yarns and threads, finished fabrics, and adhesive resins. On the other hand, price increases slowed for phosphates and nitrogenates following several months of rapid advances. Prices for leather and inedible fats and oils fell for the third consecutive month.

In the manufacturing components category, prices rose substantially for electronic components, locks, internal combustion engines, mechanical power transmission equipment, ball and roller bearings, and fluid power equipment. Among other intermediate goods, large increases were recorded for metal containers, paper boxes and containers, cutting tools, machine tool parts, abrasive products, mining machinery parts, and tractor and farm machinery parts. On the other hand, photographic supply prices turned down in response to the falling price of silver.

Crude materials

The Producer Price Index for crude materials for further processing declined 3.5 percent in April on a seasonally adjusted basis, following a 2.2 percent decrease in March. Prices for crude foodstuffs and feedstuffs decreased more than in the preceding month; crude nonfood material prices also fell but less than in the previous month.

The index for crude foodstuffs and feedstuffs fell 6.1 percent in April, considerably more than the 2.7 percent drop in March. The April decline was the largest since June 1974. Livestock prices fell more than 10.0 percent, markedly more than in the previous month. Prices for grains, soybeans, live poultry, and cocoa beans also fell sharply. Green coffee prices turned down after rising in both February and March. In contrast, prices for raw cane sugar climbed 16 percent, following a 26.4 percent decline in March. Fluid milk prices rose more than in any month since last June.

The index for crude nonfood materials less energy declined 5.1 percent, about the same as in March. Prices for scrap metals dropped substantially for the second consecutive month, and hides and skins fell more than 10 percent for the third consecutive month. Natural rubber prices also moved down. On the other hand, prices for cotton and wastepaper turned up following March declines. Iron ore prices also rose.

Prices for crude energy materials rose 2.1 percent, more than the 0.6 percent advance in March. Natural gas prices turned up following a slight decrease in March, and crude petroleum prices increased more than in the previous month.

Data from the Producer Price Index Revision

Indexes for five more industries are now being calculated under the comprehensive program to revise the Producer Price Indexes. Beginning with data for 1980, output price indexes are available for these industries, as well as for selected product classes and products included in each industry. These data are published in this report in table 4. The industries are:

Standard Industrial Classification (SIC) code	*Industry*
2653	Corrugated and solid fiber boxes
2831	Biological products
2844	Toilet preparations
3443	Fabricated platework
3651	Radios, TV's, phonographs, and related equipment

[1] These commodity indexes were moved by more detailed revision indexes as of January 1980 but will now be moved by a higher level revision index.

The revision program now covers 21 industries which account for 6.0 percent of all mining and manufacturing production.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. However, those traditional indexes which correspond to new indexes published in the revision program are now based on the movements of the corresponding revision indexes. (See tables C and D.) As new industries are published, their product indexes will also be used in the traditional commodity and ISPI structures. In 1983, an entirely new structure will replace the traditional commodity structure as the primary vehicle for reporting and analyzing price changes at the primary market level.

Table D. Industry-Sector Price Indexes based on the movement of indexes from the producer price index revision

Product code	Product
28441	Shaving preparations
28442	Perfume, toilet water, and cologne
28444	Dentifrices
28445	Other toiletries
34437	Metal tanks completed at the factory, standard line, non-pressure
36512	Television receivers, including combination models

The new indexes calculated for the PPI revision differ from traditional commodity price indexes and ISPI's in several important respects:

(1) Coverage will eventually be expanded to include *all production in mining and manufacturing industries,* whereas traditional commodity indexes have covered only about half of this value.

(2) New indexes are classified according to the widely used *Standard Industrial Classification (SIC)* and incorporate most features of the Census of Manufactures product code extensions of the SIC. Traditional commodity price indexes are grouped by a classification structure unique to BLS and are therefore difficult to use with industry-oriented economic data.

(3) New indexes use *net output values of shipments as weights* rather than gross output values. Net output values refer to the value to shipments leaving the industry and thus exclude intra-industry shipments. Therefore, new indexes consistently eliminate multiple counting of price changes at successive stages of processing. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

(4) New indexes emphasize *actual transaction prices at time of shipment* to minimize the use of list prices and order prices which occasionally have been used in traditional commodity price indexes and ISPI's.

(5) New indexes are based on prices reported for a broader range of products and by companies of all sizes selected by *probability sampling methods* rather than by a judgement of volume-selling products and major producers.

[1] Comprehensive relative importance figures are computed once each year in December.

[2] Data for December 1979 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

[4] Includes crude petroleum.

[5] Excludes crude petroleum

[6] Percent of total finished goods.

[7] Percent of total intermediate materials.

[8] Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

[9] Percent of total crude materials.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[1] Industry and product class indexes may include products not shown separately.

[2] Data for December 1979 have been revised to reflect the availability of late reports and corrections by respondents. In addition, indexes based on December 1979 = 100 have been corrected for January, February, and March 1980 because of revisions in December 1979 prices; these indexes are still subject to revision on the normal schedule. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.
